

# Management of bone and soft tissue tumours

Professor Robert Grimer.  
Consultant Orthopaedic Surgeon  
Royal Orthopaedic Hospital,  
Birmingham.  
*robgrimer@icloud.com*

# Orthopaedic Oncology

- When to be worried
- What to do
- Principles of management
  - Soft tissue lumps and bumps
  - Malignant bone tumours
  - Metastatic bone disease
  - What's new
  - Sarcomas in court

# Has the disease changed?

Osteosarcoma 1786— showing skip lesion and the eventual outcome !

# Sarcoma

## Treatment 1976

- Unchanged for years
- Near fatal disease
- Immediate amputation
- 10-15% survival
- RT for palliation

1950

1973

# Sarcoma treatment 2018

- Earlier diagnosis
- Centres of excellence
- NICE guidance
- Staging
- Adjuvant therapy (CT +/- RT)
- Limb salvage surgery
- 60%+ survival

# THE S

Sarcomas are

- Osteosarcoma
- Ewing's sarcoma
- Chondrosarcoma
- Spindle cell sarcoma
- Chordoma
- **STS**
- Metastases

# BLEM

er – 1% of all

## Size

10 cm

9 cm

11 cm

10 cm

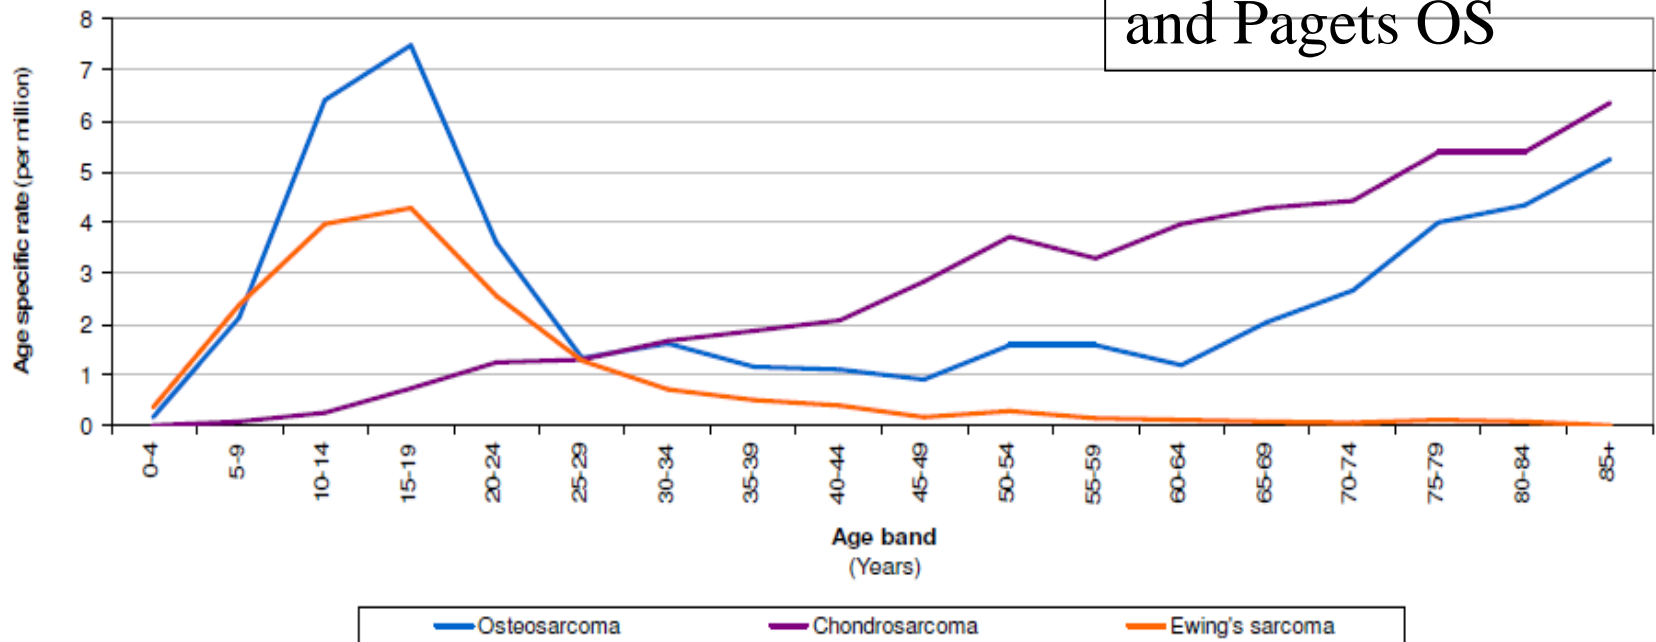

10 cm

10 cm

# Bone sarcoma incidence

- Osteosarcoma and Ewings are (mostly) tumours of adolescence
- Chondrosarcoma of adults

2<sup>nd</sup> peak OS  
= radiation induced  
and Pagets OS

# What Guidelines exist?

Earlier diagnosis - 2000

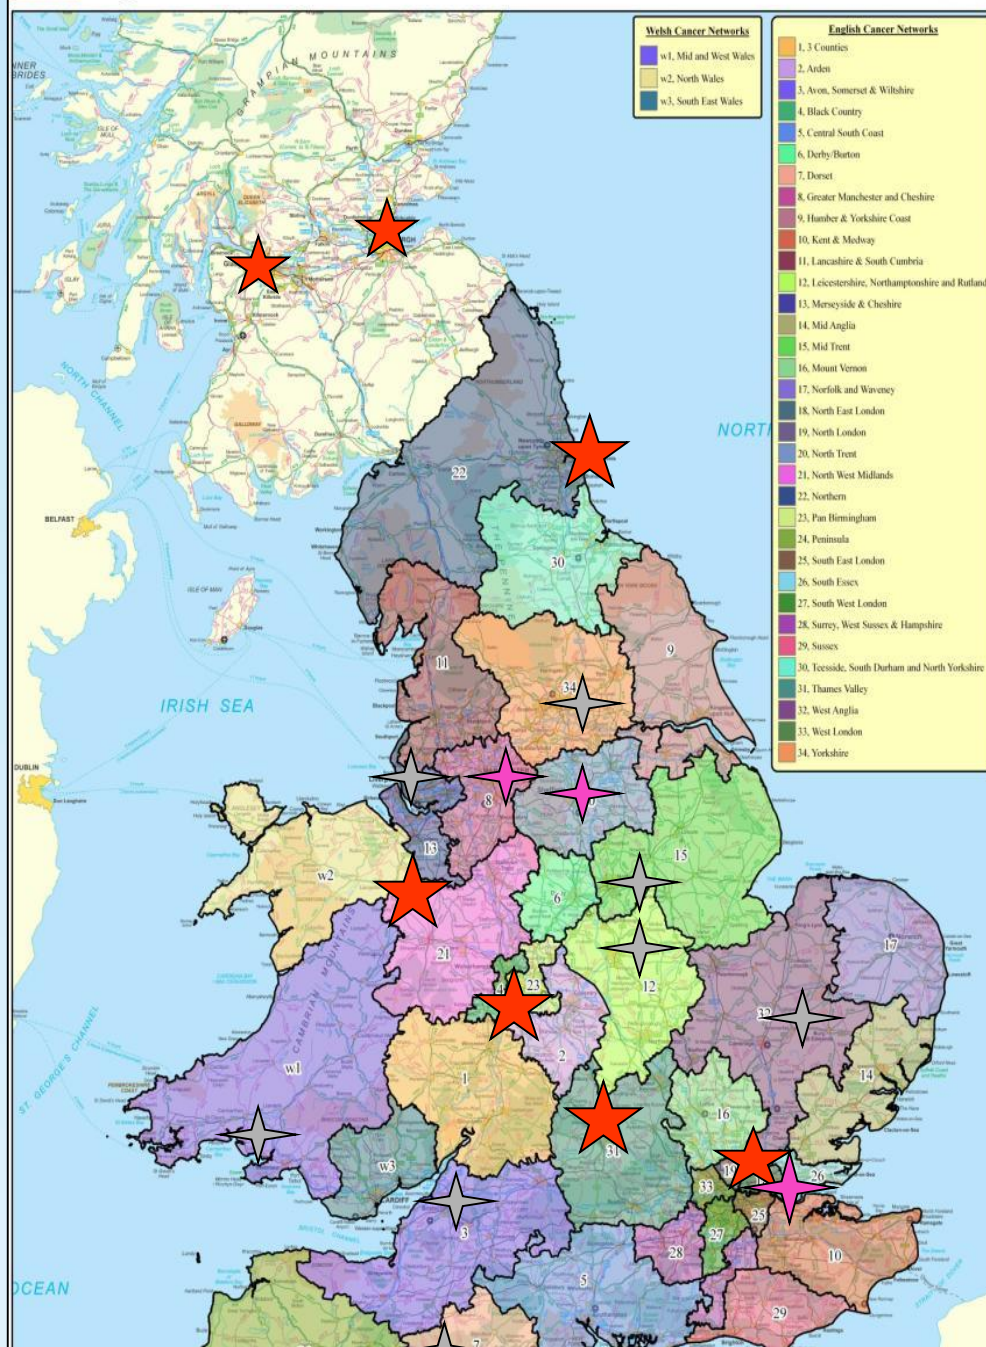

NICE early diagnosis –  
2005 and 2015

NICE Improving  
outcomes – 2006

BSG Guidelines on  
management of bone  
and soft tissue sarcomas  
- 2010 and 2016

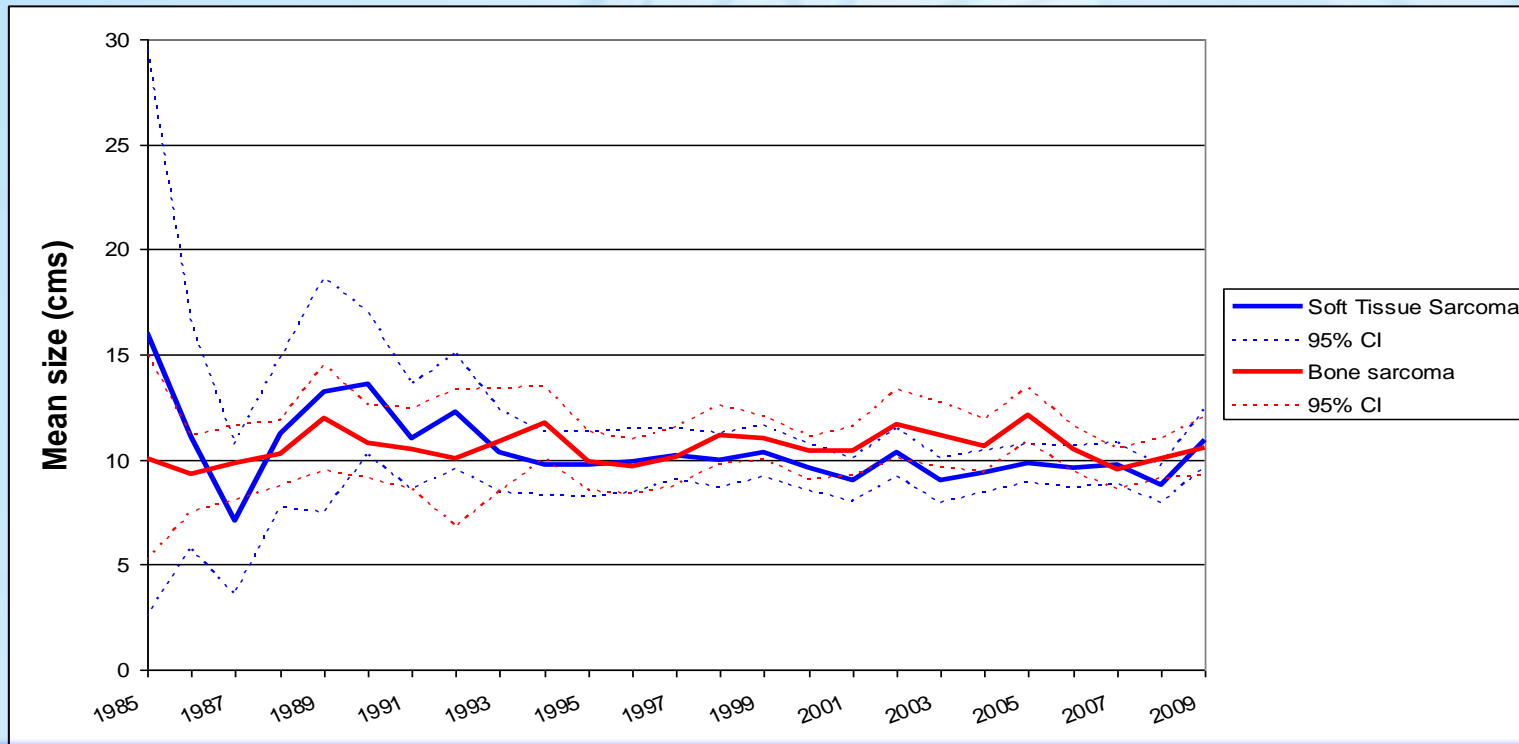

★ Bone +  
STS Centre

★ Large STS  
Centre

★ Small STS  
Centre

# Mean size of Sarcomas over 25 yrs

Bone sarcomas - no change, with time

STS – slightly improved – from 10.3cm in 1990s to 9.6cm since 2000

Women present earlier – on average tumours are 0.6cm < in men (p=0.01)

# **RECOGNISING BONE TUMOURS**

## **Symptoms:**

Non Mechanical Pain

**Night Pain**

Boney swelling

Unexplained limp

Unexplained referred pain

## **Signs:**

Swelling

Tenderness

## **Radiology:**

**Bone destruction**

**New bone formation**

**Periosteal elevation**

**Soft tissue swelling**

Any of these suggest possibility of a bone tumour and require further investigation

# Painful shoulder 4 months

6  
weeks  
later

# Solitary Lesion

No previous malignancy

## **WHAT DO I DO?**

- Is it a metastasis ?
- Is it a primary bone tumour ?
- Should I fix it now and find out what it is later ?

# POSSIBLE DIAGNOSES

- Normal (or variant)
- Congenital
- Metabolic
- Inflammatory
- Infective
- Degenerative
- Vascular

- **Neoplastic**
  - Benign
  - Malignant
    - Primary
    - Secondary
      - **Lung**
      - Breast
      - **Kidney**
      - Thyroid
      - Prostate
    - Haematological
      - **Myeloma**
      - Plasmacytoma
      - Lymphoma

# How to investigate....

- History
- Examination
- CXR
- Bloods - FBC, ESR, Profile, PSA, Myeloma
- Bone Scan
- CT Chest + Abdo
- MRI lesion
- Biopsy

## ■ ASPECTS OF CURRENT MANAGEMENT

# Earlier diagnosis of bone and soft-tissue tumours

R. J. Grimer,  
T. W. R. Briggs

*From the Royal  
Orthopaedic  
Hospital,  
Birmingham, and the  
Royal National  
Orthopaedic  
Hospital, London,*

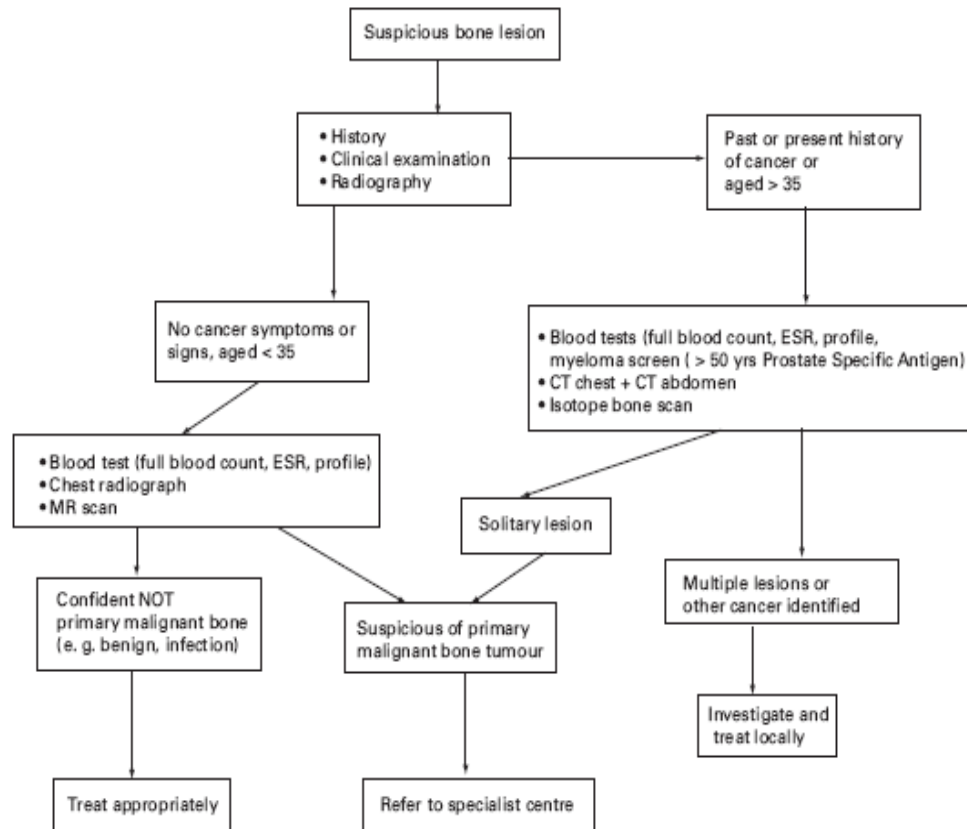

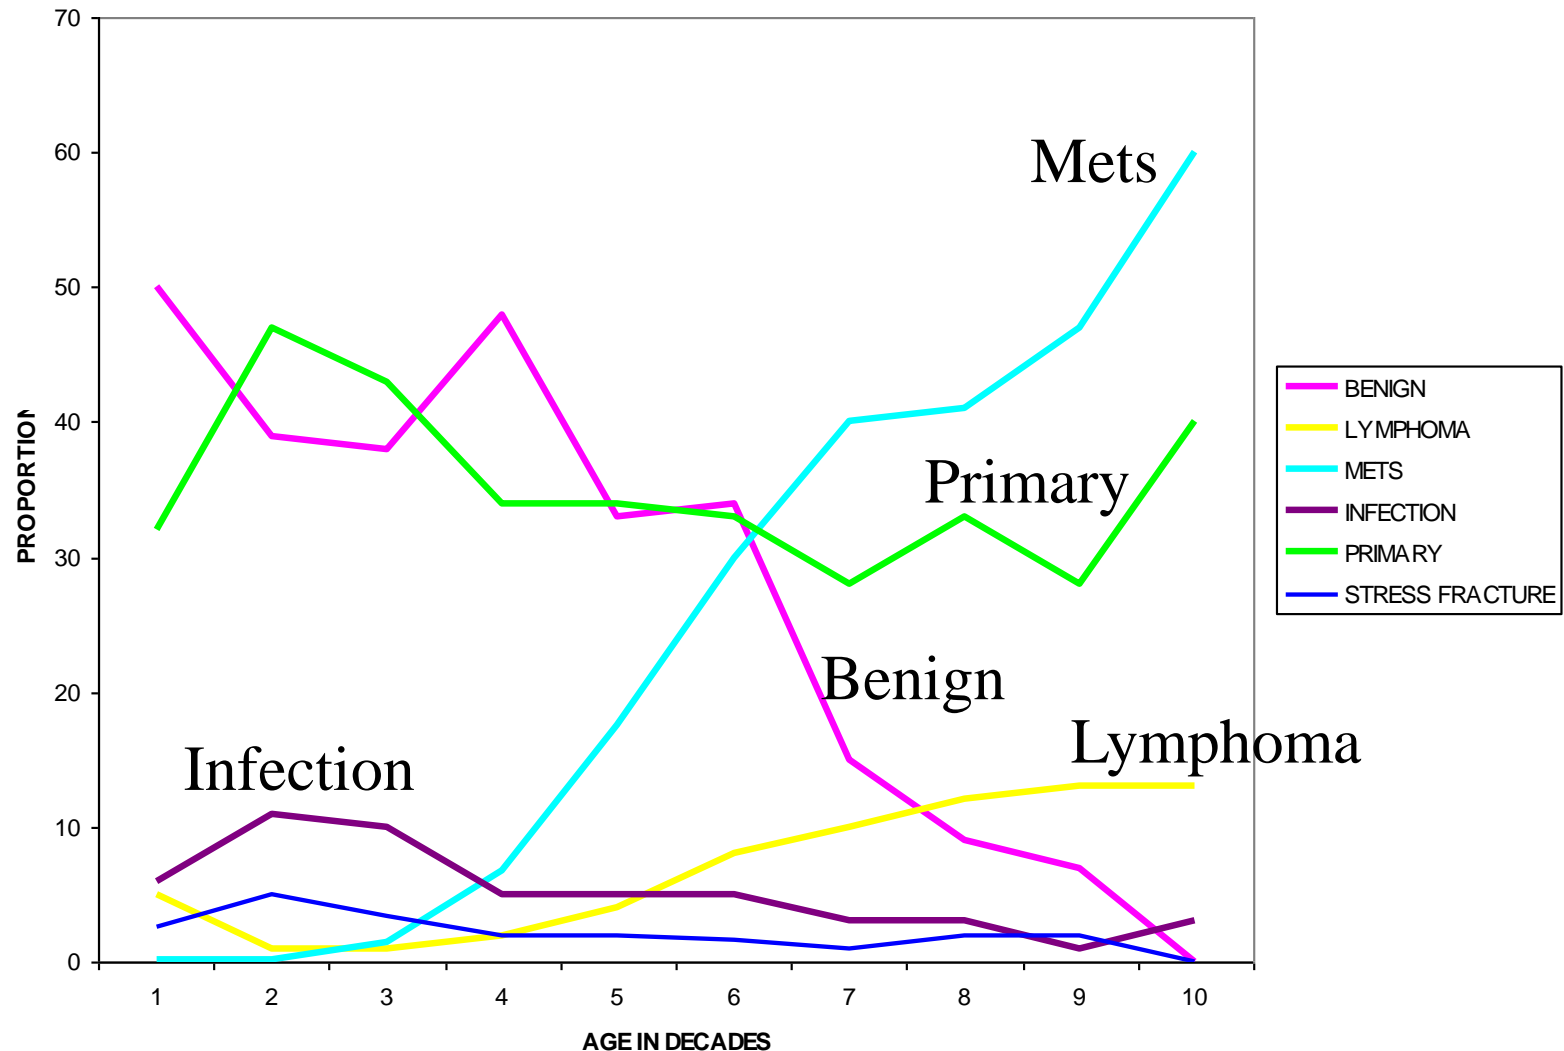

Fig. 2

Algorithm for investigating a suspicious bone lesion.

# WHAT 'FUNNY' BONES TURNED OUT TO BE!

(n=2000)

# Have a high level of suspicion...

6 weeks of  
ache – “it  
broke  
while I  
was  
shutting  
the  
curtains...”

# So don't go and mess it up....

3 months

8 months = telangiectatic osteosarcoma

# Osteosarcoma

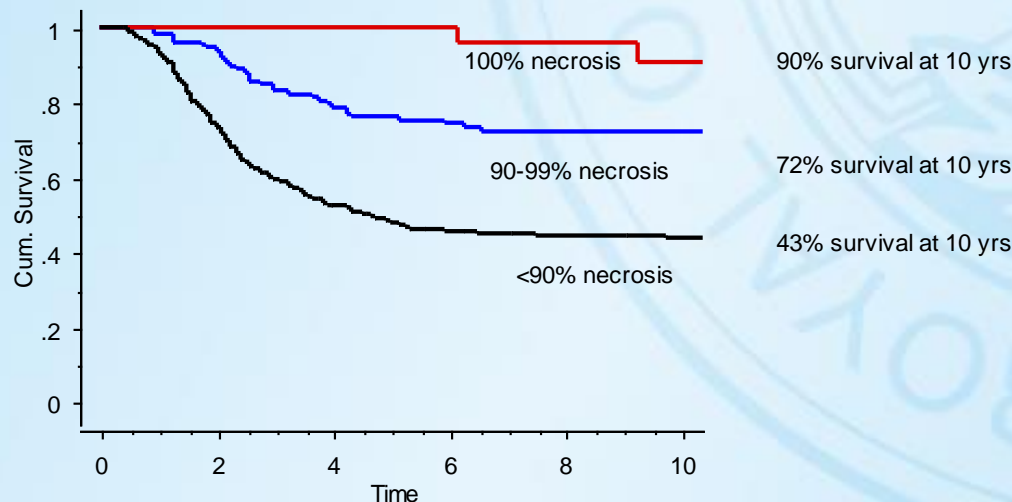

- Most common primary bone tumour
- 150/ yr, mostly adolescents
- Increasing incidence of radiation induced OS following RT for other cancers
- Typically around knee (femur, tibia)
- Present with increasing pain, limp, occasionally fracture
- XR= lytic / sclerotic / periosteal elevation
- Several different subtypes – parosteal, periosteal, low grade central, telangiectatic

# Osteosarcoma Rx

- Neoadjuvant chemotherapy
- (Adriamycin, MTX, Cisplatin, Ifosfamide)
- Resect tumour @ 10 wks
- Limb salvage in 85-90%
- Assess necrosis = very good prognostic indicator

What do  
these all  
have in  
common  
?

# Survival – Osteosarcoma varieties

# Ewing's Sarcoma

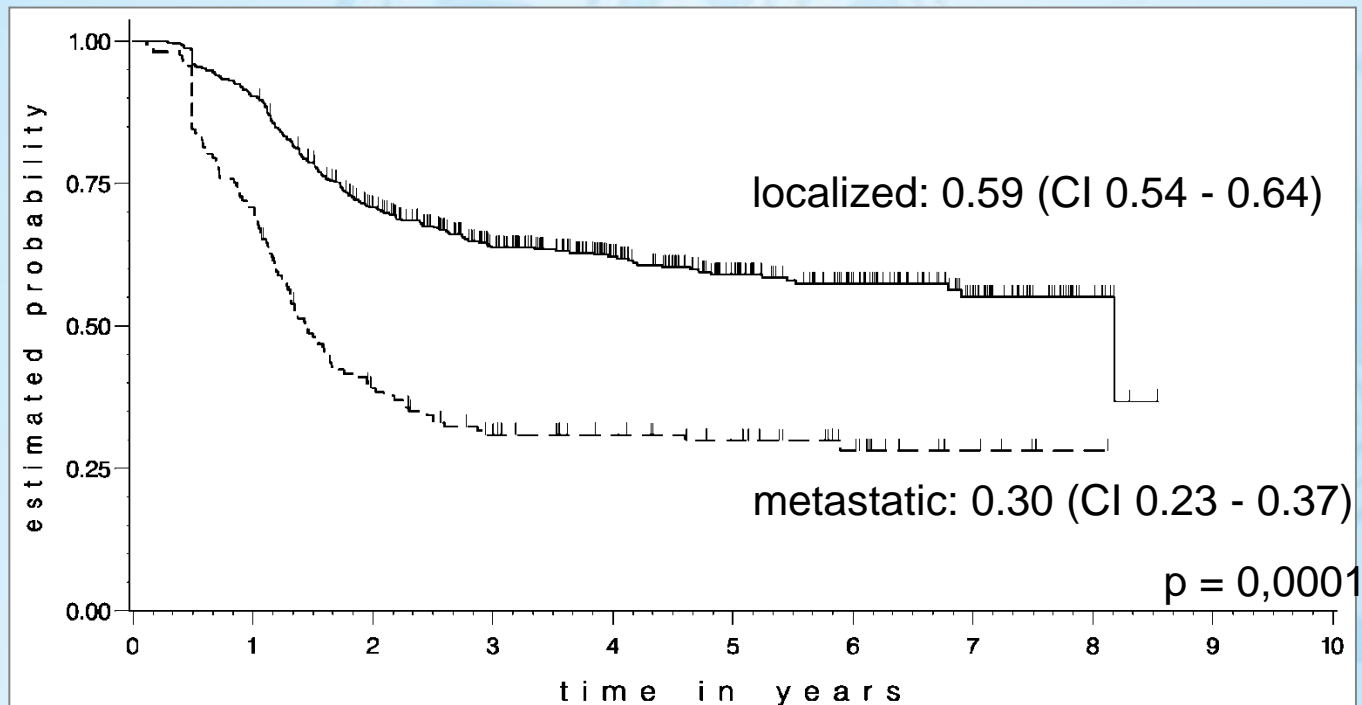

- Small blue round cell tumour
- Children and young adults
- t11/22 translocation
- Very responsive to Chemo + RT
- But high rate of recurrence
- Current Rx = CT + S + RT

# EWS

- Prognosis related to size, response to chemo, LDH at diagnosis, mets at diagnosis

# Chondrosarcoma

- Older patients
- Can be central (inside bone) or peripheral (outside bone)
- Typically present with pain or a lump
- Popcorn calcification typical inside bone
- Difficult to differentiate from benign enchondroma
- Surgery is only Rx
- Grade determines prognosis

Peripheral CS pelvis

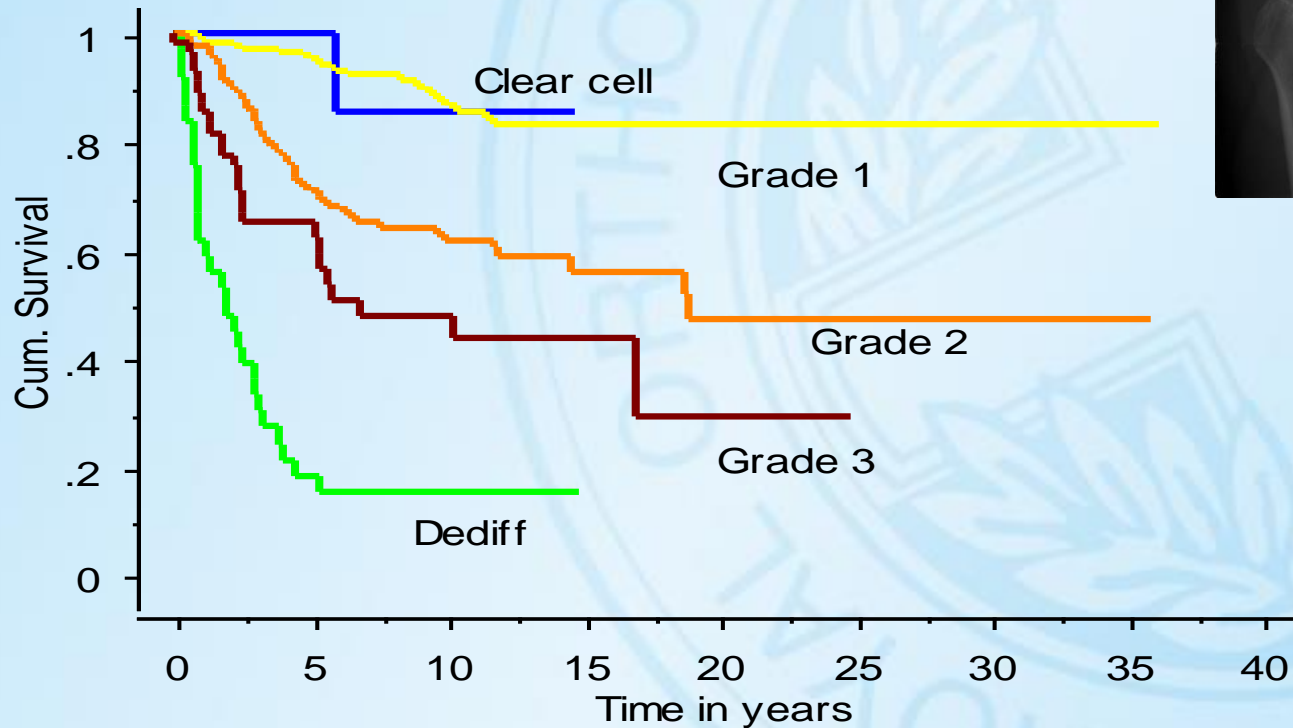

Central CS femur

# When is a chondroid lesion a chondrosarcoma?

- Many chondroid lesions discovered incidentally
- Which are malignant?
- Is observation safe?
- Histology NOT helpful
- Pelvis – always malignant
- Worrying features:
  - Pain
  - > 5cm
  - Cortical erosion
  - Hot on BS
  - Dynamic MRI
    - Parlier-Cuau C, 2011

# Chondrosarcoma survival by grade

# Chordoma

- Sacral tumour
- Present with back pain, sacral pain and eventually incontinence
- ....if you don't put your finger in it....
- Rx – surgery but increasing evidence for high dose RT with Protons or Carbon Ions

# Soft Tissue Lumps and Bumps

- Any lump presenting with the following should be considered malignant until proved otherwise:
  - **$\geq 5\text{cm}$**
  - **Increasing in size**
  - **Deep to the deep fascia**
  - **Pain**
  - **any recurrence of a previously excised lump**

**The more of these present the more likely to be malignant**

# Delays in diagnosis common

- Patient delay
- Doctor delay
- Hospital delay
- Patients pathway anything but smooth

## *Clinical Study*

### **Delays in Referral of Soft Tissue Sarcomas**

G. D. Johnson,<sup>1</sup> G. Smith,<sup>1</sup> A. Dramis,<sup>2</sup> and R. J. Grimer<sup>2</sup>

G. D. Johnson et al.

Stage	Description	Duration	Month 1				Month 2				Month 3				
			1	2	3	4	5	6	7	8	9	10	11	12	13
1	Onset of symptoms to presentation	1.3 w													
2	Presentation to 1st referral	2.4 w													
3	1st referral to 1st consultant appointment	2.2 w													
4	1st consultant appointment to referral to ROH	6.9 w													

FIGURE 2: The median patient.

thebmj

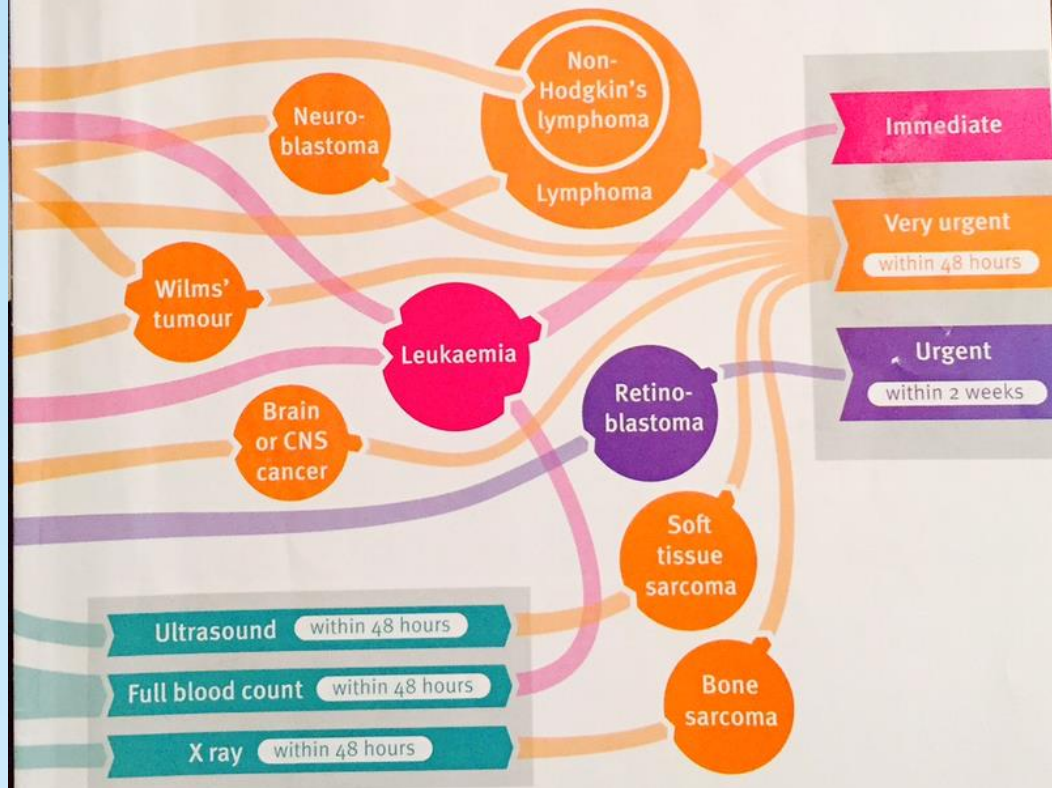

## **JOBS, COURSES, AND CAREERS**

Why public health doctors are at war over e-cigarettes

How medicine is broken and how we can fix it

How to involve patients in "do not resuscitate" orders

Treating irritable bowel syndrome  
**CPD/CME hours**

**Suspected cancer in children:  
updated NICE guidance**

The Royal Orthopaedic Hospital  
NHS Trust

# NICE 2015 New Guidance!

Any soft tissue lump that is 'unexplained' or growing – to be referred for urgent ultrasound (<48hr) – if worrying – refer on

# Soft Tissue Sarcomas increase with age

**Figure 1.2: Number of soft tissue sarcomas diagnosed in each age group and sex (England: 1985–2009)**

**Figure 1.3: Soft tissue sarcoma age specific incidence rates (England: 1985–2009)**

# ..and STS can arise anywhere!

Figure 1.5: Proportion of soft tissue sarcomas diagnosed in each age group and anatomical site (England: 1985–2009)

# A Typical Presentation.....

**MRI is investigation of choice**

# MRI may tell you what it is

- If not obviously diagnosed on MRI
- **REFER** to sarcoma diagnostic clinic
- 2 week wait
  - (local pathologists **WRONG** in 30% of sarcoma cases)

# Diagnosing a soft tissue lump

- Review images – MRI best
- Biopsy – trucut best
  - Aim NOT to contaminate normal tissue
  - Aim to get a representative sample of tumour
  - Use imaging to hit the target
  - 96% diagnostic

# What lumps can be safely excised without biopsy first?

- ☀ < 3cm
- ☀ Subcutaneous
- ☀ Well defined
- ☀ All other lumps should be investigated

# What is a 'Whoops'

- A 'Whoops' procedure is when someone has removed a lump without knowing it was a sarcoma – 50 -60% of cases will have residual tumour.
- The 'occulo-brachial reflex' – surgeon does not have to think!
- Re-excise + R/T

# Soft Tissue Sarcomas

- 3200 /yr
- Increase with age
- Many different sarcomas  
e.g.
  - Liposarcoma
  - UPS (was MFH)
  - Leiomyosarcoma
  - Fibrosarcoma
  - Rhabdomyosarcoma
  - MPNST
  - Synovial sarcoma etc.

The name is less important than the grade

# Soft tissue sarcomas in a nutshell

- Excise with clear margins
- Pre or post op R/T for most
- Amputation if unresectable or for LR
- Chemotherapy NOT predictably effective  
(but may be used in children, SS, Myxoid Liposarcoma)
- Prognosis related to Stage.....

# TNM Staging

T = Tumour size

- STS – T1  $\leq$  5cm, T2  $>$  5cm
- Bone sarcomas – T1  $\leq$  8cm, T2  $>$  8cm

G = Grade (G1 = low, G2 = Intermed G3 = high)

N = nodes

M = mets

	Size	Grade
1A	Small	G1
1B	Big	G1
2A	Small	G2-3
2B	Big	G2
3	Big	G3
4	mets	

# STS - outcome

# Size is important for survival

- Size is a prognostic factor for sarcomas
  - Metastatic disease
  - Overall survival

Survival decreases with increasing size

Metastatic disease increases with size

# How can we educate patients?

**14 yr old plays semi- professional  
football, presents with headache and  
sleepiness.....**

# “I’ve got a patient with a football on their arm !”

- \* 19 yr old male
- \* Superficial STS
- \* Hid it from his parents !!
- \* Excision, flap, RT
- \* Alive and well 5 yrs

# IF A SMALL LUMP DOESN'T LOOK RIGHT - BE SUSPICIOUS

**20 yr old with painless lump on shin –  
no trauma = Clear cell sarcoma -  
spreads along fascial planes**

**Required amputation for clearance**

**Message** – size matters for sarcomas  
– any lump bigger than a golf ball  
should be considered a possible  
sarcoma till proved otherwise.

# Margins - safe = low local recurrence

Enneking

WIDE

MARGINAL

# Local Recurrence – split by margins and grade

# Metastatic bone disease

## Principles:

- >50% of **YOU** will get cancer
- Patients with cancer living longer
- More treatments available
- More will present with metastases- most common primaries – **breast, bronchus, prostate, kidney, thyroid**
- 70% of post mortems in patients with cancer will have bone metastases
- Management is based on diagnosis, multidisciplinary Rx, maintaining function

# Will it fracture?

## Mirel's scoring system

	1	2	3
Site	Upper Limb	Lower Limb	Troch
Pain	Mild	Moderate	W/B
Lesion	Blastic	Mixed	Lytic
Size(d)	<1/3	1/3 to 2/3	>2/3

This site = Troch 3  
Pain 3  
Lytic 3  
Size 3

Total 12 = HUGE risk of fracture – so fix it!

# Right operation? – not for this one ?

# Life expectancy after bone mets

Score	0	1
No of mets	Single	Multiple
Visceral mets	None	Yes
Br/renal/thy/myeloma	Yes	Other
Karnofsky score 70	Above (self care)	Below (needs help)

Helps determine how aggressively you should treat that patient.

Review

Insight opinion to surgically treated metastatic bone disease: Scandinavian Sarcoma Group Skeletal Metastasis Registry report of 1195 operated skeletal metastasis

Maire Ratasvuori<sup>a,b</sup>, Rikard Wedin<sup>c</sup>, Johnny Keller<sup>d</sup>, Markus Nottrott<sup>e</sup>, Olga Zaikova<sup>f</sup>, Peter Bergh<sup>g</sup>, Anders Kalen<sup>h</sup>, Johan Nilsson<sup>i</sup>, Halldor Jonsson<sup>j</sup>, Minna Laitinen<sup>b,\*</sup>

# New treatments for bone mets

- New drugs
  - Breast cancer is now a chronic disease
  - Renal Cancer – sunitinib
  - Denosumab replacing bisphosphonates (reduce risk of fracture)
- Clever radiotherapy
  - Targeted treatments
- Clever radiology
  - Embolisation
  - Vertebroplasty etc

# Surgical management

- Assume fractures will not heal
- Reconstruction should out live patient
- Fill large gaps with cement not bone graft
- Most mets need RT + Denosumab/Zometa
- Consider EPR for large defects
- EPR for solitary renal mets (as poor response to RT and can have long survival)
- BOA Guidelines available:  
<https://www.boa.ac.uk/wp-content/uploads/2014/01/Metastatic-Bone-Disease.pdf>

# WHAT IS THE BEST OPERATION?

**Options include:**

**Amputation**

**Endoprosthesis**

**Allograft**

**Autograft - vascularised,  
reimplant**

**Bone distraction**

**Arthrodesis**

**Rotationplasty**

# AMPUTATION

- Once and for all operation
- Outcome predictable
- Phantom pain
- Needs good limb fitting service
- Expensive
- 15% of patients with a bone sarcoma need one

# Levels of amputation

- Level decided by need to get clearance of tumour
- Function deteriorates the higher the amputation
- Outcome unpredictable but
- QoL NOT proven to be worse for amputees than those with limb salvage!

# Amputations aren't always bad!

4 yr old with disarticulation hip  
for OS of femur and tibia.

Converted to AKA by  
prosthesis – which can be  
extended as he grows!

# Osseointegration – improving function following amputation = the future ?

Artificial limb 'clicks on' to implant a bit like a garden hose....

Patients report improved function++  
But infection risk...

# ENDOPROSTHETIC REPLACEMENT

## Advantages:

**Immediate weight bearing**

**Predictable function (80%)**

**Low early complications**

**Readily available - modular**

# Indication for EPR split by age

# Failure rates all causes and functional score

Site	Failure	Function
• Distal femur	- 2% / yr	83%
• Prox tibia	- 3% / yr	80%
• Prox femur	- 1% / yr	75%
• Prox humerus	- 0.5% / yr	86%
• Pelvis	- 3% / yr	66%
• Total femur	- 2% / yr	70%

# Infection is still the major problem

## Risk Factors

- Radiotherapy
- Myeloma
- Further surgery

## Site:

Tibia	23%
Pelvis	23%
Distal femur	10%
Prox femur	7%
Prox humerus	1%

(lifetime risk over 20 yrs)

# Navigated surgery

Helps resect complex tumours with clear margins

# EXTENDABLE EPRs FOR CHILDREN

- If  $>3\text{cm}$  of growth expected
- Use an extendable EPR
- Minimally invasive
- X Ray control
- Stab incision
- 1 cm each lengthening

# Non Invasive Extendable EPR

- Expensive - £15,000
- Lengthen 5 mm in 20 minutes
- Heavy metal magnet in motor
- Painless lengthening
- Patients (and parents) love it
- MRI not possible
- Needs minimum 12cm resection

# IN ACTION

# Non Vascularised Fibula Strut Grafts

Looks good but  
probably not necessary!

# Bone grafts

# ROTATIONPLASTY

- Safe
- Aesthetically challenging
- Excellent function
- Needs good limb fitting

# ROTATIONPLASTY

- Safe
- Aesthetically challenging
- Excellent function
- Needs good limb fitting
- No phantom pain

# EWS left femur – aged 2

**Good  
response to  
chemo**

**Rx ?**

**Amputate**

**RT**

**Replace**

**Rotationplasty**

# Now aged 25

**36 operations**  
**25 lengthen, 3 MUA, 2**  
**revisions)**  
**1 infection**

## **Was it worth it ??**

# Negligence and sarcomas

NHSLA Database - claims from 1995 to 2012

Search Words

“sarcoma” “tumour” “cancer”

Exclusions

Secondary tumours, unsettled cases

- 52 claims – 37 had negligence (71%)
- Mean cost £84,000 per case (Defence £22,000)
- Mean Compensation £92,000 (£650 - £978,000)
- Total cost £4.4 million
- 89% of claims were for delayed diagnosis

With thanks to Harrison, Sargazi and Chandrasekar (Liverpool)

# Claims to NHSLA for sarcomas

# USA Results

216 cases in a national database 1980-2012

57% favoured plaintiff

payment avge \$2.3million (\$65k-\$12.7m)

81% delay in diagnosis

11% unnecessary amputation

7% misdiagnosis

Who was at fault?

GPs - 34%

Orthopaedic surgeons - 23%

Radiologists - 12%

# Painless swelling in the foot Known to have Rheumatoid Arthritis

Reassured for 2 years - Synovial sarcoma  
Would have needed amputation anyway  
But developed metastases ....  
- would they have arisen with earlier diagnosis

12 yr old with fracture after a trivial fall  
– worried?

Internally fixed and watched for 5 months  
while bone disappeared = osteosarcoma

# Hip pain ...

- Reported as arthritis
- Actually diagnosed 3 months later as Chondrosarcoma
- Grown from 6 to 7cm
- Hindquarter amputation
- Would earlier diagnosis have made any difference?

# Did delay in diagnosis = worse outcome? -MSKCC data very helpful

- e.g. 4 cm tumour missed and only diagnosed when 8cm – it will still be in same location and same grade
